

Fontset Test: demography

Synthetic document for visual regression checks

Ada Template

Sam Sample

Household Finance Working Group

Abstract

This fake manuscript tests title-page metadata, body typography, citations, headings, mathematical notation, tables, figures, and code formatting across the available HFWG template fontsets.

Keywords: font testing, R Markdown, LaTeX template

1 Introduction

This paragraph exercises ordinary prose, *emphasis*, **strong emphasis**, inline code such as `median_income`, and citations (Burnham and Anderson 2002; Warren 2015). The metadata citation should also resolve cleanly (Household Finance Working Group 2026).

1.1 Mathematical Notation

Inline math should sit comfortably in text, as in $y_i = \alpha + \beta x_i + \epsilon_i$.

$$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$$

1.2 Table and Code

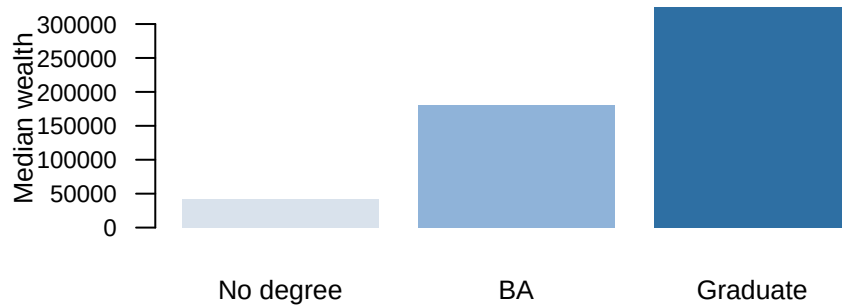

```
summary_table <- data.frame(
  group = c("No degree", "BA", "Graduate"),
  median_wealth = c(42000, 180000, 325000),
  share = c(0.52, 0.31, 0.17)
)
knitr::kable(summary_table, caption = "Synthetic household wealth by education")
```

Table 1: Synthetic household wealth by education

group	median_wealth	share
No degree	42000	0.52
BA	180000	0.31
Graduate	325000	0.17

1.3 Figure

```
barplot(
  summary_table$median_wealth,
  names.arg = summary_table$group,
  col = c("#D9E2EC", "#8FB3D9", "#2E6FA3"),
  border = NA,
  ylab = "Median wealth",
  las = 1,
  cex.axis = 0.75,
  cex.lab = 0.85,
  cex.names = 0.8
)
```

2 Conclusion

The final section gives section headings, spacing, references, and running headers a little more room to show themselves.
